

CRASH TEST

Crash test is a form of [destructive testing](#) usually performed in order to ensure safe design standards in [crashworthiness](#) and [crash compatibility](#) for cars .

In Crash test human dummies are used to test front, side, and rollover crashes. The car can receive 1 to 5 stars for each test based on the chance of serious injury to specific parts of the body. In crash test most important it is seen that what is the possibility of survival of the occupant if vehicle gets into severe accident, therefore vehicles are tested in worst scenarios and according to the results vehicle can be rated from 1 to 5 star.

Types of crashes :-

- Frontal impact test
- Moderate overlap test
- Small overlap test
- Side impact test
- Pole impact test
- Roll over test
- Road side hardware crash test
